

## Calibers

What calibre is it? What kind of firearms is it intended for?

Easy to answer if it is one of the typical cartridges.

But there is so much more out there. The **CartWin-Pro-Team** is always on the lookout for new and odd calibers. We had the 10 x 22 Rubber calibre in our database as soon as it started showing up in 2004. The database ranges from 2 mm Pinfire to 44 mm Flashball. Over 3,000 examples of firearms known in different calibers are listed as well.

Just enter the case length and the bullet diameter. The software will find all calibers within the tolerances you have given. You can also narrow the search down by including other parameters.

You can even identify the calibre of a firearm from a chamber cast.

## Manufacturers

Identifying a cartridge requires information about the manufacturer. We list well over 2,000 large and small factories, importers with brand names and other relevant addresses from past to present. Our **CartWinPro-Team** regularly browses exhibitions such as the SHOT Show®, IWA® and others for new companies. Some last only a few years, others stay for centuries. We supply data from address, phone- and fax numbers, homepage and email addresses to brand names, pictures of the logo and the successor/predecessor.

Once you have the record of a manufacturer, one click is enough to see all the headstamps or cartridges the producer is related to...

## Updates

We provide regular updates with additional records and pictures.

## Units

All measurements can be displayed either in metric units or imperial units.

## Languages

**CartWinPro** can be switched to different languages: English (US), English (British), Spanish, French, Czech, Portuguese, Portuguese (Brazilian), Italian, Dutch and German

## System requirements

**CartWinPro** runs on 'normal' office computers which operate under Windows XP® or up to Windows 10®. 10 GB of free space needs to be available for the installation. The **CartWinPro** software is provided via download or on DVD. Once installed, it will run from the hard drive.

# CartWinPro

Identification software for small caliber cartridges

# Headstamps

**CartWinPro** is most commonly used to search for headstamps. And with over 24,000 datasets it is second to none. It comprises entries with western literals and numbers, Cyrillic, Arabic, Greek and a multitude of other symbols. Centerfire, rimfire, pinfire and shotshells are included. The arrangement is shown with a computer generated drawing and in many cases is accompanied by a picture of the specimen.

The **CartWinPro-Team** takes pride in accurate and reliable data. World wide contacts to ammunition manufacturers and specialists contribute to this, as well as documented cross references to literature sources.

Using the search requires no additional computer knowledge at all. Just enter some of the letters, digits or symbols you see on the headstamp and the software will find it for you.

# Collection

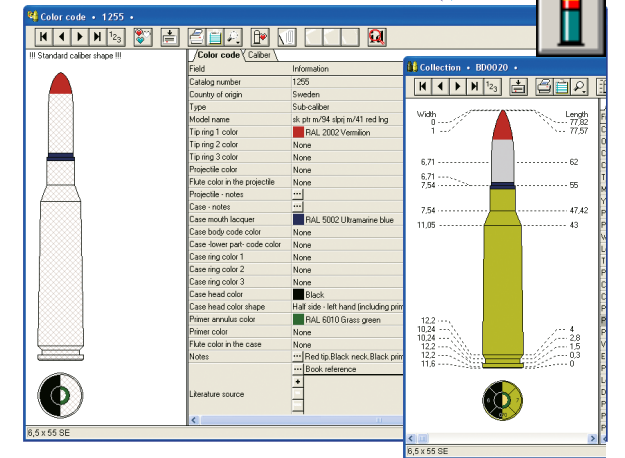

Imagine you only have a fired bullet. Wouldn't it be great to know what cartridge it came from?

With the collection database you can find it. The bullet alone is defined by up to 30 searchable record fields. From diameter, weight, markings, magnetic properties to grooves, serrations and even the shape of the base or the distances from base to groove. It is all stored in the **CartWinPro** database. The complete cartridge is shown in a colored to scale drawing with measurements and is in many cases accompanied by pictures of the cartridge, headstamp, bullet, powder, box and other details in different views.

Just enter what the bullet tells you and the software will find what fits the description in the database.

# Color codes

Having a color tipped cartridge for a legal classification usually means going through the literature and trying to find it. The color codes in **CartWinPro** are not only limited to the tip. The database comprises entries of colors on the bullet tip, the primer, annulus, shapes on the case head or on the case itself.

A red tip is not always a tracer and just the primer annulus color on a Winchester 9 Luger can for example identify a lead free round. **CartWinPro** needs only the calibre and color type and you get a list of the variations in the database. Knowing the country of origin via the headstamp narrows it down even further
